

Stanceformer: Target-Aware Transformer for

Stance Detection

Krishna Garg, Cornelia Caragea

STANCE DETECTION TASK

INPUTS: TWEET, TARGET **OUTPUT:** FAVOR/ AGAINST/ NONE

Example

Tweet: a woman ?? wanting to be equal to a man ???! what montrosity is this

Target: feminist movement

Stance: AGAINST

MOTIVATION

What if the targets are hidden from the model? Stance outputs still do not change much \rightarrow Models tend to ignore the targets

SemEval-2016

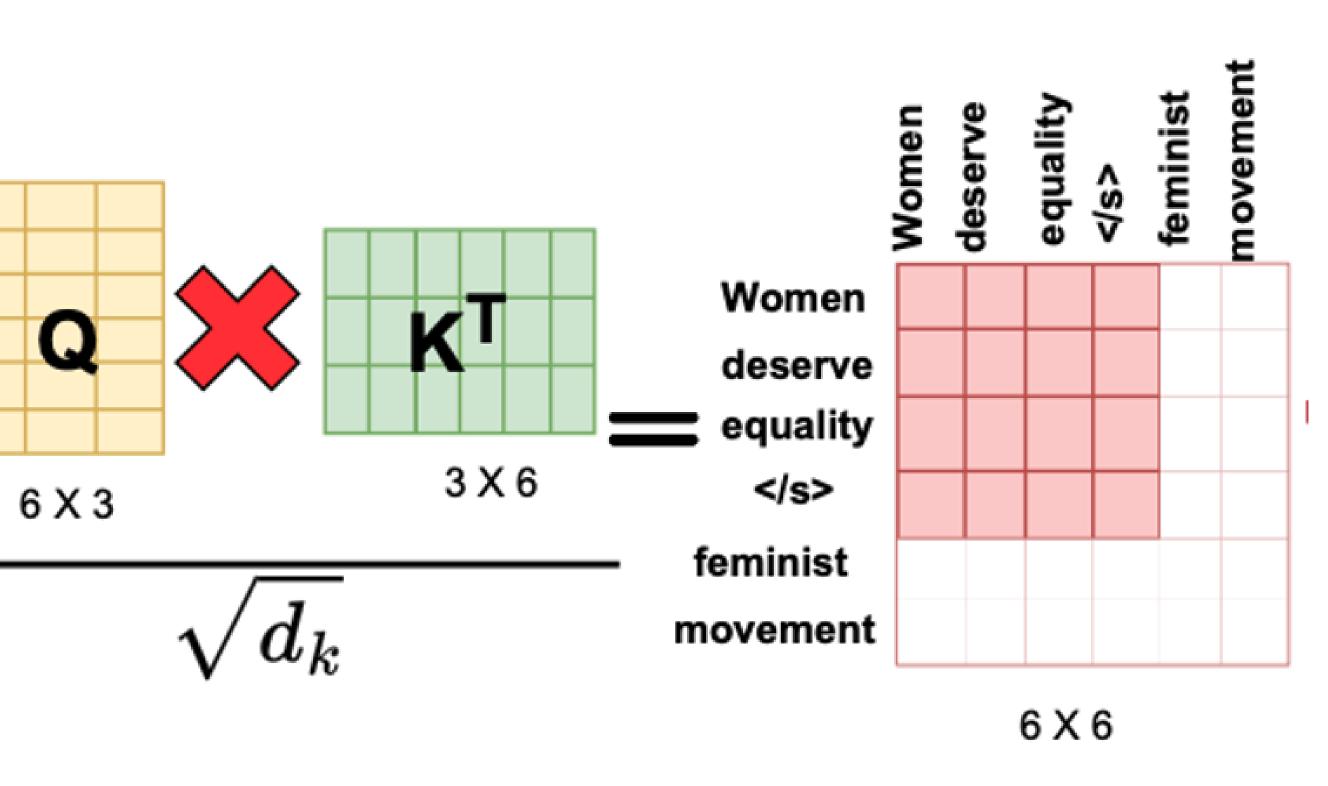

SemEval-2016	BERT	BERTweet
BERT	61.31	60.12
Targets Masked	64.23	62.63

Can the transformer-based models become more target aware? If yes, how? STANCEFORMER to the rescue

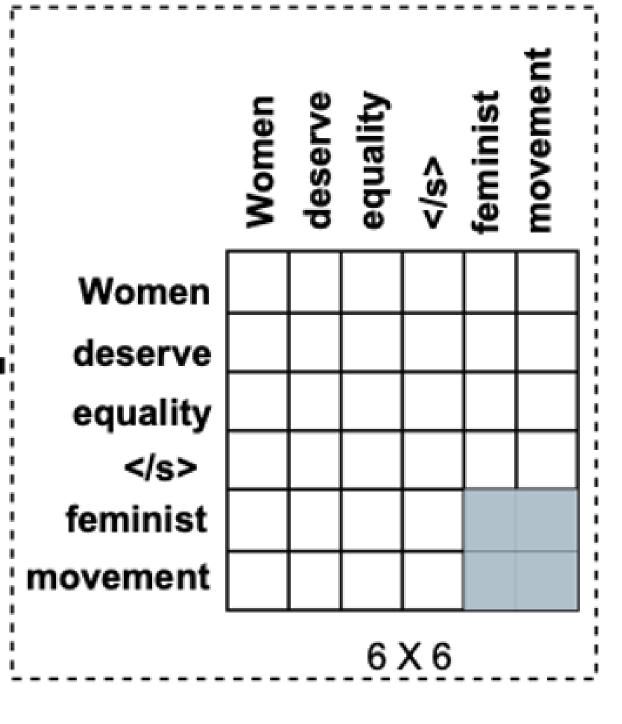

CONTRIBUTIONS

- . Propose novel Stanceformer, which uses Target Awareness Matrix for encouraging models to pay more attention to targets
- 2. Results on four Stance Detection datasets across various BERT-based models and LLMs
- 3. First to finetune LLMs for Stance Detection
- 4. Generalization to Aspect-based Sentiment Analysis

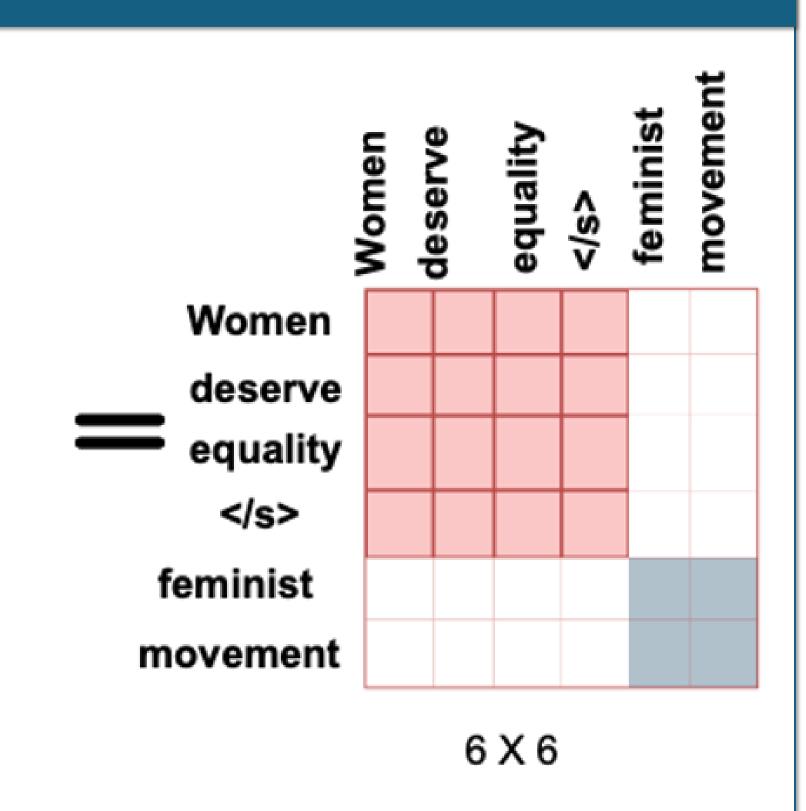

STANCEFORMER ARCHITECTURE

Target Awareness Matrix (M_{target})

Stanceformer

Self-Attention' = softmax
$$\left(\frac{QK^{T}}{\sqrt{d_k}} + \alpha M_{target}\right) * V$$

STANCEFORMER IMPROVES TARGET AWARENESS

- 1. Stanceformer outperforms BERT-based models
- 2. Stanceformer outperforms Llama-based models
- Llama-2-13b outperforms Llama-2-7b
- 4. Finetuned LLMs outperform zero-shot
- 5. LLM models often do not outperform BERT-based models

GENERALIZATION TO ABSA TASK

EXPOSING LLM RESEARCH GAPS

- 1. High variance across different seeds and prompts
- 2. Inconsistent Evaluation (accuracy depends upon seed, quality of prompt, quality of regex for parsing)
- 3. Uncontrollable LLM outputs (~15% *Abstain* cases, irrelevant strings)
